1 Introduction

In this article, I will share my journey of learning Camunda, an open-source platform for workflow and decision automation. As businesses strive for efficiency and agility, understanding tools like Camunda becomes crucial for streamlining processes and optimizing operations. I am very motivated to explore this powerful platform, and I embarked on a learning adventure to uncover the possibilities it offers.

Throughout this article, I will provide insights into the fundamentals of BPMN (Business Process Model and Notation) and its role in visualizing and modeling business processes. I will then dive into my experience with Camunda after using it in a small project, I'll also give a brief step by step learning journey from the initial installation and setup to exploring the Camunda Modeler, which allowed me to create clear and concise process diagrams.

I will also share valuable lessons learned,

1.1 Motivation and Goals

I am motivated to learn camunda as it is a necessary tool for infrastructure automation and to also enhance productivity. Here are some goals that I want to accomplish:

- Gain a solid understanding of BPMN.
- Understand camunda's workflow engine.
- Effectively model and automate complex business processes.
- Camunda integration with other systems.
- Collaboration with co-workers.

2 What is BPMN ?

2.1 Introduction

Business Process Model and Notation was developed as a graphical notation to represent complex processes and address these challenges. It is maintained by the non-profit The Object Management Group (OMG) and employed by numerous organizations globally. The visual nature of BPMN enables greater collaboration between different teams.

2.2 Basics of BPMN

Here are the foundational elements of BPMN:

- Process.
- Activities (Tasks, Sub-Processes, and Call activities).
- Events (Start Events, Intermediate Events, and End Events).
- Gateways (Exclusive, Parallel, and Inclusive Gateways)
- Sequence Flow.
- Data Objects.

Here is a figure representing BPMN components:

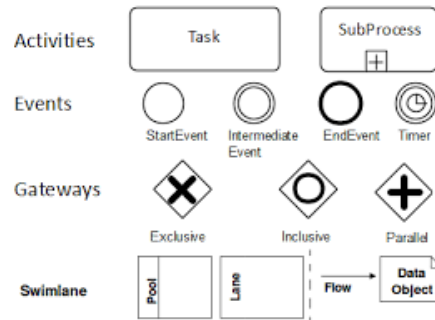

Figure 1: BPMN components

2.3 Learning Process and Resources

I started by learning the concepts of each elements used in BPMNs (tasks, symbols, activities...), and then since I had previous knowledge of modeling languages and UML diagrams, so it all seemed similiar. Then, I created some simple examples :

One of them was automating a Car Starting System (Each car executes some checks before starting). I also read some best practices on using BPMNs.

3 What is Camunda ?

3.1 Introduction

Camunda is an open-source platform for workflow and decision automation. It provides a powerful workflow engine, BPMN modeling capabilities, and tools for managing and executing business processes. With Camunda, organizations can automate and optimize their business processes, improve efficiency, and enhance visibility into process execution.

3.2 Installation and Setup

Camunda is fairly simple to install (for me I installed it in linux):

- Downloading Camunda Platform 7 Community edition from (<https://camunda.com/download/>) the linux version comes in Zip and Tar formats.
- Extract the Zip / Tar.
- Run the script './start.sh' to launch camunda platform.
- Now we can navigate to 'http://localhost:8080/camunda-welcome/index.html' and explore camunda features.

4 Creating a Simple Process

4.1 Designing a Process

For this section, I have decided to implement a small simple project using BPMN in Camunda to learn more about it. For designing the process, here are the steps I did to implement a new employee integration system:

- A start process is initiated to start the process of employee integration.
- A first task (user task) is created that represents collecting user information such as Identification, employment forms, certifications..etc
- The next task is assigning the new employee to various tasks and departements.
- Next, we execute parralel tasks (first one is a user task which orients the new employee and provides information about company policies, culture, and team introductions, and the second task is a service task which is used to automate generating welcome emails, provisioning accounts, and preparing employee workstations).
- The last task is reviewing all the documents by the HR departement to confirm completion of all tasks.
- and now the end event is triggered to end the process.

Here is how the implemented simple process looks like:

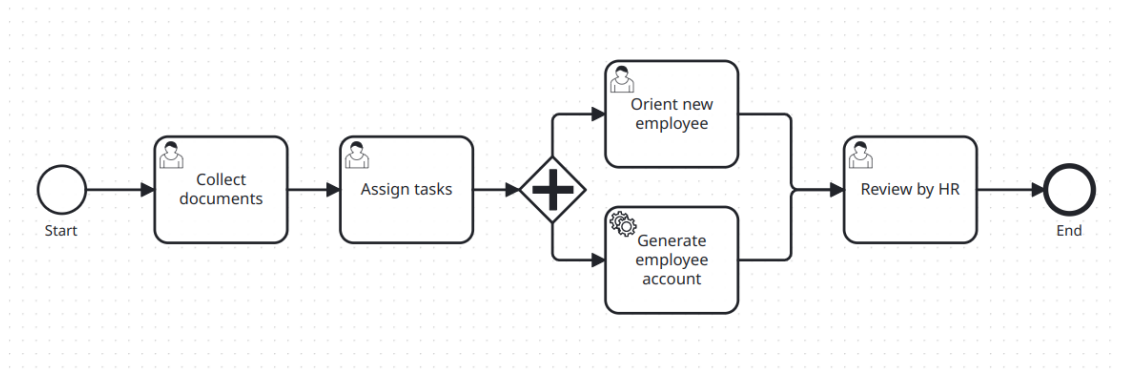

Figure 2: Simple Process

4.2 Executing the Process

Here is the process I used to deploy and execute the process:

- First, I exported the BPMN file which contains the XML representation.
- Then, we can access it on '<http://localhost:8080/camunda/app/cockpit>' by login in using demo / demo as a username and password.
- We now can create a deployment by importing the BPMN file.
- And finally, we check for the state of the process.

5 What I Learned

6 Conclusion
